**Intersection Summary**

Area Type: Other  
 Cycle Length: 60  
 Actuated Cycle Length: 60  
 Offset: 11 (18%), Referenced to phase 2:EBTL, Start of Green  
 Natural Cycle: 45  
 Control Type: Pretimed  
 Maximum v/c Ratio: 0.74  
 Intersection Signal Delay: 10.6      Intersection LOS: B  
 Intersection Capacity Utilization 64.4%      ICU Level of Service C  
 Analysis Period (min) 15  
 m Volume for 95th percentile queue is metered by upstream signal.

**Splits and Phases: 539: Post St. & Larkin St.**

Reduced v/c Ratio	0.88					0.21	0.84					0.78	

**Intersection Summary**

Area Type: Other  
 Cycle Length: 60  
 Actuated Cycle Length: 60  
 Offset: 27 (45%), Referenced to phase 6:WBTL, Start of Green  
 Natural Cycle: 50  
 Control Type: Pretimed  
 Maximum v/c Ratio: 0.82  
 Intersection Signal Delay: 14.0      Intersection LOS: B  
 Intersection Capacity Utilization 96.2%      ICU Level of Service F  
 Analysis Period (min) 15  
 # 95th percentile volume exceeds capacity, queue may be longer.  
 Queue shown is maximum after two cycles.  
 m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 557: Sutter St. & Polk St.

**Intersection Summary**

Area Type: Other  
 Cycle Length: 90  
 Actuated Cycle Length: 90  
 Offset: 55 (61%), Referenced to phase 2:NBT, Start of Green  
 Natural Cycle: 80  
 Control Type: Pretimed  
 Maximum v/c Ratio: 0.89  
 Intersection Signal Delay: 24.0                      Intersection LOS: C  
 Intersection Capacity Utilization 91.2%                      ICU Level of Service F  
 Analysis Period (min) 15  
 # 95th percentile volume exceeds capacity, queue may be longer.  
 Queue shown is maximum after two cycles.  
 m Volume for 95th percentile queue is metered by upstream signal.

**Splits and Phases: 418: Grove St. & Van Ness Avenue**

**Intersection Summary**

Area Type: Other  
 Cycle Length: 90  
 Actuated Cycle Length: 90  
 Offset: 24 (27%), Referenced to phase 6:SBT, Start of Green  
 Natural Cycle: 80  
 Control Type: Pretimed  
 Maximum v/c Ratio: 1.00  
 Intersection Signal Delay: 22.9      Intersection LOS: C  
 Intersection Capacity Utilization 81.8%      ICU Level of Service D  
 Analysis Period (min) 15  
 # 95th percentile volume exceeds capacity, queue may be longer.  
 Queue shown is maximum after two cycles.  
 m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 466: Turk St. & Gough St.

 Analysis Period (min) 15  
 ~ Volume exceeds capacity, queue is theoretically infinite.  
   Queue shown is maximum after two cycles.  
 # 95th percentile volume exceeds capacity, queue may be longer.  
   Queue shown is maximum after two cycles.  
 m Volume for 95th percentile queue is metered by upstream signal.

**Intersection Summary**

Area Type: Other  
 Cycle Length: 90  
 Actuated Cycle Length: 90  
 Offset: 32 (36%), Referenced to phase 2:NBTL, Start of Green  
 Natural Cycle: 55  
 Control Type: Pretimed  
 Maximum v/c Ratio: 0.93  
 Intersection Signal Delay: 22.2                      Intersection LOS: C  
 Intersection Capacity Utilization 76.5%                      ICU Level of Service D  
 Analysis Period (min) 15  
 # 95th percentile volume exceeds capacity, queue may be longer.  
 Queue shown is maximum after two cycles.  
 m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 489: Ellis St. & Franklin St.

**Intersection Summary**

Area Type: Other  
 Cycle Length: 90  
 Actuated Cycle Length: 90  
 Offset: 44 (49%), Referenced to phase 2:NBT, Start of Green  
 Natural Cycle: 110  
 Control Type: Pretimed  
 Maximum v/c Ratio: 1.18  
 Intersection Signal Delay: 115.3      Intersection LOS: F  
 Intersection Capacity Utilization 93.3%      ICU Level of Service F  
 Analysis Period (min) 15  
 ~ Volume exceeds capacity, queue is theoretically infinite.  
 Queue shown is maximum after two cycles.  
 # 95th percentile volume exceeds capacity, queue may be longer.  
 Queue shown is maximum after two cycles.  
 m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 500: Starr King & Franklin St.

**Intersection Summary**

Area Type: Other  
 Cycle Length: 90  
 Actuated Cycle Length: 90  
 Offset: 9 (10%), Referenced to phase 6:SBT, Start of Green  
 Natural Cycle: 80  
 Control Type: Pretimed  
 Maximum v/c Ratio: 1.09  
 Intersection Signal Delay: 54.9  
 Intersection LOS: D  
 Intersection Capacity Utilization 88.3%  
 ICU Level of Service E  
 Analysis Period (min) 15

- ~ Volume exceeds capacity, queue is theoretically infinite.  
 Queue shown is maximum after two cycles.
- # 95th percentile volume exceeds capacity, queue may be longer.  
 Queue shown is maximum after two cycles.
- m Volume for 95th percentile queue is metered by upstream signal.

**Intersection Summary**

Area Type:	Other
Cycle Length:	90
Actuated Cycle Length:	90
Offset:	76 (84%), Referenced to phase 2:NBT, Start of Green
Natural Cycle:	80
Control Type:	Pretimed
Maximum v/c Ratio:	0.86
Intersection Signal Delay:	11.4
Intersection LOS:	B
Intersection Capacity Utilization:	63.1%
ICU Level of Service:	B
Analysis Period (min):	15

m Volume for 95th percentile queue is metered by upstream signal.

**Splits and Phases: 902: Jackson St. & Van Ness Avenue**

 Natural Cycle: 95  
 Control Type: Pretimed  
 Maximum v/c Ratio: 1.14  
 Intersection Signal Delay: 42.0 Intersection LOS: D  
 Intersection Capacity Utilization 87.7% ICU Level of Service E  
 Analysis Period (min) 15  
 ~ Volume exceeds capacity, queue is theoretically infinite.  
 Queue shown is maximum after two cycles.  
 # 95th percentile volume exceeds capacity, queue may be longer.  
 Queue shown is maximum after two cycles.  
 m Volume for 95th percentile queue is metered by upstream signal.

**Intersection Summary**

Area Type: Other  
 Cycle Length: 90  
 Actuated Cycle Length: 90  
 Offset: 45 (50%), Referenced to phase 2:EBTL and 5:SBR, Start of Green  
 Natural Cycle: 80  
 Control Type: Actuated-Coordinated  
 Maximum v/c Ratio: 0.89  
 Intersection Signal Delay: 16.5      Intersection LOS: B  
 Intersection Capacity Utilization 72.4%      ICU Level of Service C  
 Analysis Period (min) 15  
 # 95th percentile volume exceeds capacity, queue may be longer.  
 Queue shown is maximum after two cycles.

**Splits and Phases: 923: Lombard St. & Franklin St.**

**Intersection Summary**

Area Type: Other  
 Cycle Length: 90  
 Actuated Cycle Length: 90  
 Offset: 9 (10%), Referenced to phase 6:SBL, Start of Green  
 Natural Cycle: 90  
 Control Type: Pretimed  
 Maximum v/c Ratio: 1.01  
 Intersection Signal Delay: 26.2 Intersection LOS: C  
 Intersection Capacity Utilization 90.7% ICU Level of Service E  
 Analysis Period (min) 15  
 ~ Volume exceeds capacity, queue is theoretically infinite.  
 Queue shown is maximum after two cycles.  
 # 95th percentile volume exceeds capacity, queue may be longer.  
 Queue shown is maximum after two cycles.  
 m Volume for 95th percentile queue is metered by upstream signal.

**Splits and Phases: 1390: Haight St & Market St.**

Cycle Length:	90
Actuated Cycle Length:	90
Offset:	64 (71%), Referenced to phase 6:SBTL, Start of Green
Natural Cycle:	130
Control Type:	Pretimed
Maximum v/c Ratio:	1.30
Intersection Signal Delay:	126.2
Intersection LOS:	F
Intersection Capacity Utilization	112.1%
ICU Level of Service	H
Analysis Period (min)	15
~	Volume exceeds capacity, queue is theoretically infinite. Queue shown is maximum after two cycles.
#	95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.
m	Volume for 95th percentile queue is metered by upstream signal.

**Splits and Phases:** 412: Hayes St. & Gough St.

**Intersection Summary**

Area Type: Other  
 Cycle Length: 90  
 Actuated Cycle Length: 90  
 Offset: 63 (70%), Referenced to phase 2:NBSB, Start of Green  
 Natural Cycle: 85  
 Control Type: Pretimed  
 Maximum v/c Ratio: 1.05  
 Intersection Signal Delay: 51.9      Intersection LOS: D  
 Intersection Capacity Utilization 91.0%      ICU Level of Service F  
 Analysis Period (min) 15

- ~ Volume exceeds capacity, queue is theoretically infinite.  
 Queue shown is maximum after two cycles.
- # 95th percentile volume exceeds capacity, queue may be longer.  
 Queue shown is maximum after two cycles.
- m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Area Type: Other

Cycle Length: 60

Actuated Cycle Length: 60

Offset: 27 (45%), Referenced to phase 2:EBT, Start of Green

Natural Cycle: 60

Control Type: Pretimed

Maximum v/c Ratio: 0.94

Intersection Signal Delay: 17.0

Intersection LOS: B

Intersection Capacity Utilization 57.9%

ICU Level of Service B

Analysis Period (min) 15

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 540: Post St. & Hyde St.

# Appendix 12

## Signal Warrant Analysis and Significant Impact Calculations

### Warrant 3B: Peak Hour Volume

The peak hour volume warrant is satisfied when the plotted point representing the vehicles per hour on the major street (total of both approaches) and the corresponding vehicles per hour of the higher volume minor street approach (one direction only) for one hour (any consecutive 15-minute periods) of an average day falls above the curve in Figure 4C-3 for the existing combination of approach lanes.

### Analysis

	No. of Lanes
Major Street	2
Minor Street	1

Time	Vehicles per Hour	
	Major Street (Sum of both approaches)	Minor Street (High volume approach)
5:00 PM	613	271

**Warrant Not Met**

### Warrant 3B: Peak Hour Volume

The peak hour volume warrant is satisfied when the plotted point representing the vehicles per hour on the major street (total of both approaches) and the corresponding vehicles per hour of the higher volume minor street approach (one direction only) for one hour (any consecutive 15-minute periods) of an average day falls above the curve in Figure 4C-3 for the existing combination of approach lanes.

### Analysis

	No. of Lanes
Major Street	2
Minor Street	1

Time	Vehicles per Hour	
	Major Street (Sum of both approaches)	Minor Street (High volume approach)
5:00 PM	660	246

**Warrant Not Met**

### Warrant 3B: Peak Hour Volume

The peak hour volume warrant is satisfied when the plotted point representing the vehicles per hour on the major street (total of both approaches) and the corresponding vehicles per hour of the higher volume minor street approach (one direction only) for one hour (any consecutive 15-minute periods) of an average day falls above the curve in Figure 4C-3 for the existing combination of approach lanes.

### Analysis

	No. of Lanes
Major Street	2
Minor Street	1

Time	Vehicles per Hour	
	Major Street (Sum of both approaches)	Minor Street (High volume approach)
5:00 PM	644	242

**Warrant Not Met**

### Warrant 3B: Peak Hour Volume

The peak hour volume warrant is satisfied when the plotted point representing the vehicles per hour on the major street (total of both approaches) and the corresponding vehicles per hour of the higher volume minor street approach (one direction only) for one hour (any consecutive 15-minute periods) of an average day falls above the curve in Figure 4C-3 for the existing combination of approach lanes.

### Analysis

	No. of Lanes

Larkin/Jackson	5:00 PM	703	290

**Warrant Not Met**

**Warrant 3B: Peak Hour Volume**

The peak hour volume warrant is satisfied when the plotted point representing the vehicles per hour on the major street (total of both approaches) and the corresponding vehicles per hour of the higher volume minor street approach (one direction only) for one hour (any consecutive 15-minute periods) of an average day falls above the curve in Figure 4C-3 for the existing combination of approach lanes.

**Intersection Summary**

Area Type: Other  
 Cycle Length: 90  
 Actuated Cycle Length: 90  
 Offset: 24 (27%), Referenced to phase 6:SBTL, Start of Green  
 Natural Cycle: 60  
 Control Type: Pretimed  
 Maximum v/c Ratio: 0.95  
 Intersection Signal Delay: 32.6      Intersection LOS: C  
 Intersection Capacity Utilization 94.8%      ICU Level of Service F  
 Analysis Period (min) 15  
 # 95th percentile volume exceeds capacity, queue may be longer.  
 Queue shown is maximum after two cycles.  
 m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 478: Eddy St. & Gough St.

## Local Preferred Alternative (LPA) Comparison Memorandum

# MEMORANDUM

DATE: October 10, 2012

TO: Michael Schwartz, Jeffery Bingham and Kim Franchi

FROM: Preethi Narayanan/Chi-Hsin Shao

RE: Van Ness Avenue BRT LPA Traffic Analysis Update – Revised October 10, 2012

---

The purpose of this memo is to present the methodology, assumptions and results of the traffic analysis of the LPA for the 2015 and 2035 horizon years. The proposed LPA is a modified version of the Center Lane BRT with Design Option B Alternative analyzed for the DEIR. The proposed modification includes elimination of exclusive right-turn lanes at 11 locations. Right-turns can be made from the shared-through lane at these locations. Exclusive right-turn lanes would be provided at only three Van Ness Avenue locations in the LPA: SB Pine, SB Market and SB Mission/ Otis.

## **Methodology**

The 2015 and 2035 LPA Synchro Models were developed by modifying the 2015 and 2035 Center Lane BRT Design Option B Synchro DEIR models respectively. Exclusive right-turn lanes were eliminated at 11 locations along Van Ness Avenue and were replaced by shared through-and-right lanes in the models at the following locations:

1. NB Market
2. SB McAllister
3. NB Golden Gate
4. NB O'Farrell
5. SB Geary
6. NB Post
7. SB Sutter
8. NB Bush
9. NB California
10. SB Sacramento
11. NB Clay

The LPA models include exclusive right-turn lanes only at three locations along Van Ness Avenue: SB Pine, SB Market and SB Mission/ Otis.

Both, the 2015 and 2035 LPA models assumed the same volume, signal timings and signal offsets as the Center Lane BRT with Design Option B Synchro models to help make comparison of results between the LPA and DEIR models easy.

## **Traffic Analysis Results**

Attached Table 1 provides a comparison of the 2015 and 2035 LPA and DEIR Center Lane BRT with Design Option B Alternative intersection LOS, and approach LOS, delay and 95th percentile queue results for approaches that have been modified. The key results are as follow:

1. In 2015, the intersection LOS and approach LOS at all 11 intersections analyzed under LPA would be the same as the corresponding LOS under the Center with Design Option B Alternative.
2. In 2015 under the LPA, the queue length would be within the one- block and the queue would not block the upstream intersection at all 11 intersections.
3. In 2035, the intersection LOS and approach LOS would decline slightly at some intersections analyzed under the LPA. However, the intersection and approach LOS would remain at acceptable LOS A, B, C or D at all 11 intersections under the LPA.
4. In 2035 under the LPA, the queue generated after the elimination of exclusive right-turn lanes would spill over and block the upstream intersections approach at two locations; the queue on southbound Van Ness at Geary would spill over and block southbound approach at Post; the queue on northbound Van Ness at Post would spill over and block northbound approach at Geary. But this is the worst-case scenario, estimated to occur less than 5% of the time. The results show that the average queue would be contained within the block length. The queue length at the remaining 9 intersections analyzed under the LPA would be within the one- block distance and the queue would not block the upstream intersection.

## **Conclusion**

The results show that the approaches and intersections under the 2015 LPA have the capacity to accommodate and service the right-turn vehicles in their shared lanes without causing extensive queues. In 2035, 9 out of 11 intersections analyzed have similar results of acceptable LOS and no queue spillage. However, at 2 locations - northbound Van Ness at Post and southbound Van Ness at Geary, the 95<sup>th</sup> percentile queue generated after the elimination of exclusive right-turn lanes would extend and block their respective downstream intersections in the worst-case scenario, thus causing traffic congestion. The scenario would occur less than 5% of the time. On average, the queue would be contained within the block length at these two locations.

## Pedestrian Volume Sensitivity Analysis

# MEMORANDUM

DATE: January 3, 2013  
TO: Michael Schwartz  
FROM: Chi-Hsin Shao  
RE: Sensitivity of Pedestrian Volumes

---

The purpose of this memo is to present the vehicular impacts of the estimated future BRT users accessing BRT bus stops along Van Ness Avenue under the Locally Preferred Alternative.

## Van Ness Avenue BRT bus passenger volumes

Most BRT passengers are expected to walk to the proposed BRT bus stops to board and alight from buses. Thus, hourly pedestrian volumes on crosswalks at the intersections in the vicinity of the proposed BRT bus stop locations would increase as seen in Table 1. Table 1 also shows crosswalks with a reduction in pedestrian volumes. Relocation of some existing Route 47 and 49 bus stops would cause pedestrians to reroute to access the new bus stops and thus pedestrian volumes along crosswalks in the vicinity of relocated bus stops would decrease.

**Table 1 Change in Hourly Pedestrian Volumes at Van Ness Avenue Intersections**

	West	North	East	South
Mission	15	-52	15	0
Market	200	240	200	705
McAllister	35	99	35	78
Eddy	-15	28	-15	25
O'Farrell	255	1084	255	-50
Geary	255	18	255	1149
Sutter	49	125	49	-58
Bush	49	0	49	197
Sacramento	18	127	18	0
Clay	52	340	52	-33

## Sensitivity of Vehicular Delay to Pedestrian Volumes

An increase in pedestrian volumes along crosswalks could potentially increase delay and degrade levels of service for traffic turning right and left from the cross street on permitted signal phase. The turning vehicles may have to wait longer for higher number of pedestrian to cross before

they can finish their turn. To evaluate sensitivity of vehicular traffic delay to pedestrian volumes, the right and left turn pedestrian conflict volumes at intersections in the vicinity of the proposed bus stops were increased or reduced by the pedestrian volumes seen in Table 1. This analysis was only conducted for the 2035 Locally Proffered Alternative (LPA), to understand the impacts in the worst case scenario with highest vehicular volumes.

The model results as seen in Table 2 show NO CHANGE in the Impact findings at the select intersections. The LOS would remain the same as the LPA model for all intersections. The intersection delay would increase by less than 1 second per vehicle at all intersections except Geary and Van Ness. The increase in intersection delay (1.3 second per veh) at Geary would be due to substantial increase in pedestrian conflicts for all permitted turning movements. However, the intersection LOS would remain C.

Synchro modeling software was used for analyzing vehicular impact analysis in the EIR and was used for this analysis to be consistent. However, Synchro vehicular delay calculations are not very sensitive to pedestrian volumes and associated conflicts. This may partially explain the relatively small increase in delay at intersections with large increase in pedestrian values.

**Table 2 2035 LPA model Intersection LOS Comparison**

Intersection	LPA model in EIR		LPA with updated Ped volumes		Change in Delay
	Delay (Seconds)	LOS	Delay (Seconds)	LOS	
Van Ness & Mission	79	E	79	E	0
